Installation - General Information

1 - Fluid recommendations

Premium quality hydraulic mineral oil fluids are recommended, like H-LP oils to DIN 51542 part 2.
The oil viscosity range should be from 25 mm²/s to 50 mm²/s. Operating temperature from -10° C to 70° C are recommended.
For other fluids such as phosphoric acid esters or for other operating conditions please consult our Tech.Dpt.

2 - Seals

NB (Nitrile) seals are used for operation with hydraulic fluids based on mineral oil.
For synthetic, as perhaps phosphoric acid ester, Fluorocarbon seals are required.
For any assistance please consult our Tech.Dpt.

3 - Filtration

Contamination of the hydraulic oil may cause trouble with the pump and shorten its life.
For maximum pump and system component functionality and life, the system should be protected from contamination by effective filtration. Fluid cleanliness should be in accordance with classification ISO 4406.

The quality of filter elements should be in accordance with ISO standards

Minimum requirement for filtration rate:

General hydraulic system for satisfactory operation: Class 19/17/14 to ISO 4406 (Class 9 NAS 1638)

Hydraulic system with maximized component life and reliability: Class 17/15/12 to ISO 4406 (Class 7 NAS 1638)

It is recommended to use return or pressure line filter, a wide range of filters for all common application are available.

The use of suction filter should be avoided, especially with fast response pump.

Off-line filtration is a good choice for the best filtering efficiency.

4 - Installation and mounting

Horizontal mounting: Outlet port, side or top; Inlet port, side or bottom; Drain port always uppermost.

Vertical mounting: Drive shaft vertically upward.

Install pump and suction line in such a way that the maximum inlet vacuum never exceeds 0,8 bar absolute.

The inlet line should be as short and straight as possible.

A short suction line cut to 45° is recommended when the pump is mounted inside the reservoir, to improve the inlet conditions.

All connections to be leadfree, as air in the suction line will cause cavitation, noise and damage the pump.

5 - Allignement and installation

Pump and motor shaft must be aligned within 0,25 mm. T.I.R max. A floating coupling must be used.

Please follow the coupling manufacturer's installation instruction. Consult our Tech.Dpt. in event of radial load drives.

6 - Start-up

Prior to start-up, the pump case must be filled with clean system hydraulic fluid (use case drain port).

Do not operate the pump at full speed right away. Instead, turn the motor input switch on - off several times so as to extract air from the piping, then operate it continuously.

Initial start-up should be at zero pressure with an unloaded circuit to enable the pump to prime.

Pressure should only be increased once the pump has been fully primed.

Attention: Check the motor rotation direction.

Operating noise of pumps

The normal operating noise of a pump and consequently the operating noise of the entire hydraulic system is largely determined by where and how the pump is mounted and connected to the hydraulic system.

Also size, style and installation of the hydraulic tubing have a major influence on the overall noise emitted by a hydraulic system.

Noise reducing measures

Flexible element help to prevent pump body vibration being trasmitted to other construction elements, where possible amplification may occur. Such element can be:

- 1 - Floating and flexible coupling.
- 2 - Damping rails.
- 3 - Or silent block for mounting the electric motor or the foot mounting flange.
- 4 - Flexible tube connections (compensator) or hoses for inlet, outlet and drain port.
- 5 - Exclusive use of gas tight tube fittings for inlet connection to avoid air entry causing cavitation and excessive noise.

7 - Drain line

The case pressure must not exceed 0,04 MPa (0,36 bar).

The drain line must be connected directly to the reservoir without restriction and must not be connected to any other return line.

The end of the drain line must be below the lowest fluid level in the reservoir and as far-away as possible from the pump input line to ensure that the pump does not empty itself when not in operation and that the hot oil will not recirculated.

For the same reason, when the pump is mounted inside the reservoir, the drain line should be arranged in such a way that a siphon is created. For drain line size and lenght refer to the table below.

Pump model	V 15 - V 18 - V 23 - V25	V 38 - V 42	V 50 - V70
Pipe joint size	3/8"	1/2"	3/4"
Pipes internal diam.	> 12 mm.	> 15 mm.	> 18 mm
Pipes lenght	< 1 m.		

V Series Axial Piston Pump - Spare Parts (pump body)

V Series AXIAL PISTON PUMP

FEATURES

The latest design in the proven V Series, medium pressure, open loop system variable displacement pump has been developed for the mobile and industrial market where low noise, high overall efficiency, excellent controllability, extended pump life and high reliability are all considered essential.

The features such as high efficiency, compact design, long life and a wide range of control options allow each of the V Series units to be easily matched to any application.

Specially designed for the noise-critical application, its rigid and compact structure reduces air borne noise emissions. All noise reduction features of the V Series provide a typical reduction of 6dB(A) compared with conventional designs.

Technical Characteristics

V Series AXIAL PISTON PUMP

ORDER CODE

FUNCTIONAL DESCRIPTION OF REGULATOR

Control Type	Hydraulic Symbol	Control Curve
A - Pressure compensator control 1 - When system pressure increase and reach preset pressure the flow decrease automatically and pressure maintain without changing. 2 - Flow and pressure can be adjusted manually.		
B - Multi-stage flow & single-stage pressure control (with cylinder) 1 - Flow can be adjusted form zero to maximum and pressure can have been maintaining at preset pressure. 2 - Absorbing impact and vibration which are produced by up and down motions of actuators. It is suitable for lifting equipment etc...		
C - Two-stage pressure & flow control 1 - Low consumption electric motor can be selected to save energy because of the functions of high flow at low pressure and low flow at high pressure. 2 - When pressure increase and reach preset pressure "PH", flow is reduced to "QL". 3 - Pressure "PH-PL" and Flow "QH QL" can be adjusted optionally. 4 - It is applied to actuators requiring long unloaded or short loaded strokes. Speedy and horse-power efficient.		
CG - Two-stage remote pressure & flow control 1 - The same function of "C" control type. 2 - The pressure range can be adjusted remotely by the integrated remote pressure control valve. 3 - Proportional Electro-Hydraulic pressure control can be applied with proportional valve.		

FUNCTIONAL DESCRIPTION OF REGULATOR

Control Type	Hydraulic Symbol	Control Curve
D - Solenoid controlled pressure compensating control with unloading device 1 - Same as Type "A" and unloading function added. 2 - It is applied to systems requiring long time unloading operation. 3 - When solenoid is turned off, the pump operates under unloading conditions. This results in less noise and heat generation.		
DG - Solenoid controlled pressure compensating control with unloading & remote device 1 - The same function of "D" control type 2 - The pressure range can be adjusted remotely by the integrated remote pressure control valve. 3 - Proportional Electro-hydraulic pressure control can be applied with proportional valve.		
E - Dual pressure control 1 - High and low pressure can be controlled by switching directions of solenoid control valve. 2 - This type is applied to actuators requiring 2-stage pressures with single speed. 3 - One of "PL" and "PH" relief valves can optionally be high pressure.		
EG - Dual & remote pressure control 1 - The same function of "E" control type 2 - The pressure range can be adjusted remotely by the integrated remote pressure control valve. 3 - Proportional Electro-hydraulic pressure control can be applied with proportional valve.		

FUNCTIONAL DESCRIPTION OF REGULATOR

Control Type	Hydraulic Symbol	Control Curve
F - Two flow - Two pressure p.c. by solenoid operated valve 1 - Actuators can be shifted slowly (high pressure low flow) and quickly (low pressure high flow) by switching directions of solenoid control valve. 2 - This type is applied to actuator requiring operations to shift speed from high to low or low to high. 3 - Pressure "PL, PH" and flow "QL, QH" can be adjusted optionally.		
FG - Two flow - Two pressure p.c. by solenoid operated & remote valve 1 - The same function of "F" control type. 2 - The pressure range can be adjusted remotely by the integrated remote pressure control valve. 3 - Proportional Electro-hydraulic pressure control can be applied with proportional valve.		
G - Remote pressure compensator control 1 - The same function of "A" control type. 2 - The pressure range can be adjusted remotely by the integrated remote pressure control valve.		
GJ - Proportional pressure with interface 1 - The same function of "GM" control type and proportional valve added. 2 - The proportional valve is installed on the NG 6 interface to reach proportional electro-hydraulic control to save energy.		
GM - Remote interface (valve not included) 1 - GM control with a NG6 interface, supply an installation for pilot valve to prove the operating pressure. The pressure setting can be set directly from the control panel of the machine. 2 - The remote pressure compensator responds faster and offer more stable pressure. 3 - The adjustment can also be manual or proportional pressure control.		

FUNCTIONAL DESCRIPTION OF REGULATOR

Control Type	Hydraulic Symbol	Control Curve
HL - Load sensing compensator control 1 - The pump outlet can be controlled by the setting pressure value of control valve. An ideal energy conservation system can be configured by combining the proportional directional control. 2 - When setting pressure value, flow is changed depending on the throttle valve. The sensing flow feedback function can reach to low oil heat generation and saving energy.		
HJ - Load sensing & proportional electro-hydraulic pilot relief valve 1 - The same function of "HL" and proportional function added. 2 - Supplied with proportional electro-hydraulic pilot relief valve can reach to power saving.		
HK- Proportional electro-hydraulic load sensing control 1 - This control type supply the system pressure and flow depending on the proportional pressure and flow, voltage and load value to save energy. When in waiting circle, the outlet displacement and horse-power loss are close to zero. When pressure reaches to preset value, the flow decrease to the min. and the pressure is constant to reach low oil heat generation and energy loss. 2 - HK control type can save 30-50% energy compared to vane and gear pump + PQ valve. It is an energy saving and environmental design.		
HQ - Load sensing proportional flow control 1 - The same function of "HL" control type and proportional flow function added. 2 - The proportional flow control allows the adjustment of the pump output flow with an electric input signal. Pump flow rate are controlled proportionally to the input current to the control device on the pump and the input current is regulated by the specific amplifier.

Piping Connection Flanges

F5 - 10 - WA - 90

Serial No. 90° Flange
Bore No. Piping type
Same appearance
Piping smaller size (special product)

A: Screw thread connecting type PT or NPT
B: Welding type
C: Inserted welding type (4-hole thread)
D: Inserted welding type (Non-oil sealing)
E: Blind hole F: Blind hole (4-hole thread)
G: Middle thread (4-hole thread)
